{Redefinition} $G_{union}(i, j, k)$

Actions that have undefined behaviour, such as out-of-bounds array indexing, are inexpressible in the Guarded Query Language. Therefore, for any array-index pairing A_i , there is an implicit constraint that $i \in [0, A.len)$.

Thus

$$= \{ \text{Implicit constraints} \}$$

$$((A_i > B_j) \lor (B_j > C_k) \lor (C_k > A_i) \lor (A_i = B_j = C_k)) \land (i \in [0, A.len) \land j \in [0, B.len) \land k \in [0, C.len))$$

With these new implicit constraints, we can conclude that

$$inv \land guard \implies ((A_i > B_j) \lor (B_j > C_k) \lor (C_k > A_i) \lor (A_i = B_j = C_k))$$

 $\land (i \in [0, A.len) \land j \in [0, B.len) \land k \in [0, C.len))$

For convenience

$$implicit_constraints(i, j, k) \triangleq i \in [0, A.len) \land j \in [0, B.len) \land k \in [0, C.len)$$

By counter-example, let r, i, j, k = 0, A.len, 0, 0, and choosing $A = \{0\}$, $B = \{1\}$, $C = \{1\}$, s.t. A.len = 1, B.len = 1 and C.len = 1.
